## General Methods

Solvents and reagents were purchased from commercial suppliers and used as provided without further purification unless stated otherwise. Solvents (THF, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, DMF) were dried over activated $4 \AA$ molecular sieves. Cation exchange resin DOWEX $50 \mathrm{H}^{+}$was regenerated by consecutive washing with $\mathrm{HCl}(3 \mathrm{M})$, water and dry MeOH . If not indicated otherwise, concentration of organic solutions was performed under reduced pressure at $<40^{\circ} \mathrm{C}$. Optical rotation was measured with an Anton Paar MCP100 Polarimeter at $20^{\circ} \mathrm{C}$. Reactions were followed by thin layer chromatography using Merck plates: generally on $5 \times 10 \mathrm{~cm}$, layer thickness 0.25 mm , Silica Gel $60 \mathrm{~F}_{254}$; alternatively on HPTLC plates with 2.5 cm concentration zone (Merck). Spots were visualized with UV (254 nm) and/or anisaldehyde- $\mathrm{H}_{2} \mathrm{SO}_{4}$ staining. Preparative chromatography was performed using silica gel ( $0.040-0.063$ mm ) or a flash-purification system (Interchim, PuriFlash 4125). NMR spectra were recorded with a Bruker Avance III 600 instrument ( ${ }^{1} \mathrm{H}$ at $600 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 151 MHz and ${ }^{31} \mathrm{P}$ at 243 MHz ) using standard Bruker NMR software. Chemical shifts are given in ppm down-field from $\mathrm{SiMe}_{4}$ using the residual peak of $\mathrm{CDCl}_{3}\left(7.26\right.$ for ${ }^{1} \mathrm{H}$ and 77.00 for ${ }^{13} \mathrm{C}$ ), $\mathrm{CD}_{3} \mathrm{OD}\left(3.31\right.$ for ${ }^{1} \mathrm{H}$ and 49.86 for $\left.{ }^{13} \mathrm{C}\right)$ or $\mathrm{D}_{2} \mathrm{O}\left(0.00\right.$ for ${ }^{1} \mathrm{H}$, external calibration to 2,2-dimethyl-2-silapentane-5-sulfonic acid), 67.40 for ${ }^{13} \mathrm{C}$ (external calibration to 1,4-dioxane in $\left.\mathrm{D}_{2} \mathrm{O}\right)$, and orthophosphoric acid $(\delta=0)$ for ${ }^{31} \mathrm{P}$. Assignments for octyl signals are labeled with '. Numbering of phosphonate compounds was based on the nomenclature as hexit-1-yl derivatives. HR MS ESITOF data were obtained on a Waters Micromass Q-TOF Ultima Global instrument.

## General conditions for hydrogenation of 9, 13 and 15:

Hydrogenation was carried out in a ThalesNano H-Cube® reactor under the following conditions: flowrate $0.5 \mathrm{~mL} / \mathrm{min}$, cartridge length 30 mm , catalyst $20 \% \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}$, temperature $50{ }^{\circ} \mathrm{C}$, nominal $\mathrm{H}_{2}$ pressure 50 bar. The starting material (typically 10 mg ) was dissolved in $5-10 \mathrm{~mL}$ of a $1: 1 \mathrm{MeOH}-\mathrm{AcOH}$ mixture and was run in loop for 2-3 h. After this time, the crude mixture was concentrated in vacuo, filtered over a syringe filter $(0.45 \mu \mathrm{~m}, \mathrm{MeOH})$ and concentrated to dryness. All products were purified on a semi-preparative Merck SeQuant® ZIC®-HILIC ( $250 \times 10 \mathrm{~mm}$ ) HPLC column ( $\mathrm{MeCN} \rightarrow 1: 1 \mathrm{MeCN}-\mathrm{H}_{2} \mathrm{O}, 8 \mathrm{~mL} / \mathrm{min}$ ).

NaH (60\% in mineral oil, $444 \mathrm{mg}, 11.1 \mathrm{mmol}, 2.1$ eq.) was suspended in dry DMF (10 mL ) and the mixture was cooled to $0^{\circ} \mathrm{C}$. A solution of $1^{1}(1 \mathrm{~g}, 5.29 \mathrm{mmol})$ in dry DMF $(20 \mathrm{~mL})$ was added dropwise under an inert atmosphere and stirring was continued at $0{ }^{\circ} \mathrm{C}$ for 30 min . Next, benzyl bromide ( $1.32 \mathrm{~mL}, 11.1 \mathrm{mmol}, 2.1 \mathrm{eq}$.) was added dropwise, the reaction mixture was allowed to reach rt and stirring was continued for 22 h . The reaction was quenched by adding $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$ under cooling, which was followed by extraction with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). Combined organic phases were washed with $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$, brine $(20 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated in vacuo. The crude material was flash-chromatographed on silica gel (MePh $\rightarrow 1: 1 \mathrm{MePh}$ EtOAc) to give 1.536 g ( $79 \%$ ) of 2 as colorless oil, which solidified upon cooling. Physical and spectroscopic data were in agreement with literature. ${ }^{2}$

## Oxidation of 4-azido-2,3-di-O-benzyl-4-deoxy-L-arabinopyranose (3)

Methyl glycoside 2 ( $100 \mathrm{mg}, 0.27 \mathrm{mmol}$ ) was dissolved in a solution of $\mathrm{SrCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (5 $\mathrm{mg}, 0.02 \mathrm{mmol}, 0.07 \mathrm{eq}$.$) in 1 \mathrm{~mL}$ of glacial AcOH and the mixture was warmed to 70 ${ }^{\circ} \mathrm{C}$. Diluted aq $\mathrm{HCl}(5 \mathrm{M}, 0.16 \mathrm{~mL}, 0.81 \mathrm{mmol})$ was added dropwise and the resulting solution was stirred at $70{ }^{\circ} \mathrm{C}$ for 3 h and then for 70 h at rt . The reaction mixture was made neutral by adding a satd aq solution of $\mathrm{NaHCO}_{3}(3 \mathrm{~mL})$ and extracted with EtOAc (3 x 3 mL ). Combined organic phases were dried $\left(\mathrm{MgSO}_{4}\right)$, concentrated in vacuo and flash-chromatographed on silica gel ( $4: 1 \mathrm{MePh}-\mathrm{EtOAc} \rightarrow$ EtOAc) to afford 3 as an oil which solidified upon standing. Yield: 58 mg ( $60 \%$ ). NMR data matched published data. ${ }^{2}$ The anomeric mixture was directly used without further separation. Lactol 3 ( $1.22 \mathrm{~g}, 3.43 \mathrm{mmol}$ ) was dissolved in DMSO ( 10 mL ) followed by dropwise addition of acetic anhydride ( $8 \mathrm{~mL}, 85 \mathrm{mmol}$ ) under an inert atmosphere. The solution was stirred at rt overnight ( 22 h ) and concentrated in vacuo at $50^{\circ} \mathrm{C}$. DMSO was removed by lyophilization and drying under high vacuum ( $<1$ mbar) to give 4 (4-azido-2,3-di-O-benzyl-4-deoxy-L-arabinonic acid 1,5-lactone) as unstable brownish oil. ## Method A

Phosphonate 9 ( $85 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ ( $373 \mathrm{mg}, 1.15 \mathrm{mmol}$ ) were suspended in dry DMF ( 2 mL ) and warmed to $80^{\circ} \mathrm{C}$ under an inert atmosphere. Then octyl bromide ( $99 \mu \mathrm{~L}, 0.57 \mathrm{mmol}, 3 \mathrm{eq}$ ) was added dropwise and the suspension was stirred for 2 h at $80^{\circ} \mathrm{C}$ : The crude mixture was allowed to cool down and was concentrated under reduced pressure. The residue was suspended in MeOH , mixed with silica gel ( $\sim 2 \mathrm{~g}$ ), concentrated in vacuo $\left(40^{\circ} \mathrm{C}\right)$ and the solid material was placed on top of a silica gel column and eluted with $\mathrm{MePh} \rightarrow \mathrm{EtOAc}$, which gave 59 mg ( 55 $\%)$ of 14 and $33 \mathrm{mg}(31 \%)$ of $\mathbf{1 2}$ as yellow oils.
