## 1. Asymmetric $\mathbf{O}$-Acylation Reactions:

## General procedure for the screening of different acyl-transfer reagents 4:

Racemic 4-hydroxy[2.2]paracyclophane ( $\mathbf{2}, \mathbf{0 . 1} \mathbf{~ m m o l}$ ) and catalyst ITU $\mathbf{2}$ ( $10 \mathrm{~mol} \%$ ) were dissolved in dry toluene ( 1.5 mL ) in a Schlenkflask under argon, before adding Hünig's base (diisopropylethylamine, DIPEA; 0.06 mmol ) as a solution in toluene ( 0.15 mL ). This solution was then cooled to $-40^{\circ} \mathrm{C}$ and a solution of acylating agent 4 ( 0.6 mmol ) in 0.15 mL toluene was added (resulting in a concentration of 0.055 M with respect to 2 ) and the mixture stirred for 4 h . The reaction was quenched with MeOH in the cold and allowed to reach room temperature. The crude product was filtered over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvents removed in vacuum, before the desired product was purified by column chromatography.

## Analytical data for other O-acylated paracyclophanes 3

3b: Following the general procedure using anhydride 4d, a conversion of $45 \%$ of rac-2 was achieved.

3b Ester 3b was obtained as a white solid after silica gel column chromatography using heptanes/ethyl acetate (10:1); e.r. = 68:32 ( $s=2.5$ ); TLC (heptanes/ethyl acetate $=10 / 1$ ): $\boldsymbol{R}_{f}=0.21$ (UV).
